

CLINICAL EVIDENCE | Endoform[®] Antimicrobial

Endoform[®] Antimicrobial provides broad spectrum antimicrobial protection of the dressing for up to seven days

- Dermal wounds are at risk of microbial colonization, as are the dressings used to manage them.
- Applications of collagen/silver dressings reduce the risk of bacterial infection in wound dressings that would otherwise be susceptible to colonization.¹
- Antimicrobial dressings prevent the likelihood of colonization within the dressing allowing tissue to focus on healing rather than fighting off infection.²
- Ionic silver is well established in wound management and de-risks microbial colonization of the dressing.³
- **Endoform[®] Antimicrobial** contains ionic silver that protects the dressing for up to seven days.⁴ **Endoform[®] Antimicrobial** is protected from microbial colonization, including clinically relevant bacteria, yeast and mold.⁴
- Relative to existing collagen/silver dressings, **Endoform[®] Antimicrobial** is well tolerated by cells, which may provide additional safety to end users.⁵
- **Endoform[®] Antimicrobial** retains the structure of collagen in normal tissue, as well as, important secondary molecules that aid healing.⁵
- **Endoform[®] Natural** has been shown to be effective in a range of acute and chronic wounds⁶; **Endoform[®] Antimicrobial** extends this utility to provide additional clinical benefit for at risk wounds.

Fibroblasts with no silver

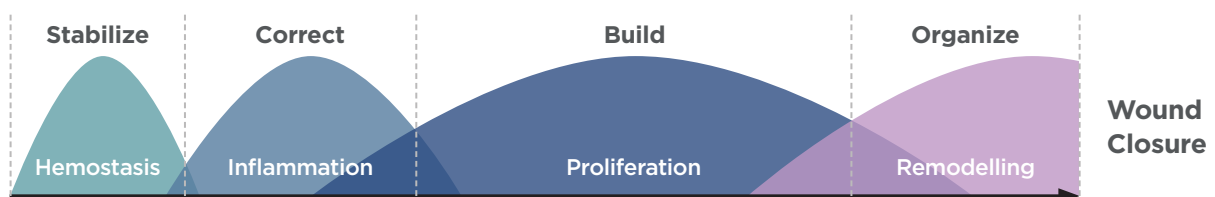

Fibroblasts + Endoform[®] Antimicrobial

Spectrum of Protection

1. *Acinetobacter baumannii*
2. *Candida albicans*
3. *Candida parapsilosis*
4. *Candida glabrata*
5. *Escherichia coli*
6. Methicillin Resistant *Staphylococcus aureus* (MRSA)
7. *Staphylococcus epidermidis*
8. *Streptococcus pyogenes*
9. *Pseudomonas aeruginosa*
10. *Aspergillus niger*
11. Vancomycin Resistant *Enterococci* (VRE)

Endoform[®] can be used at all phases of wound management
